

SIMPLY EXPLAINED

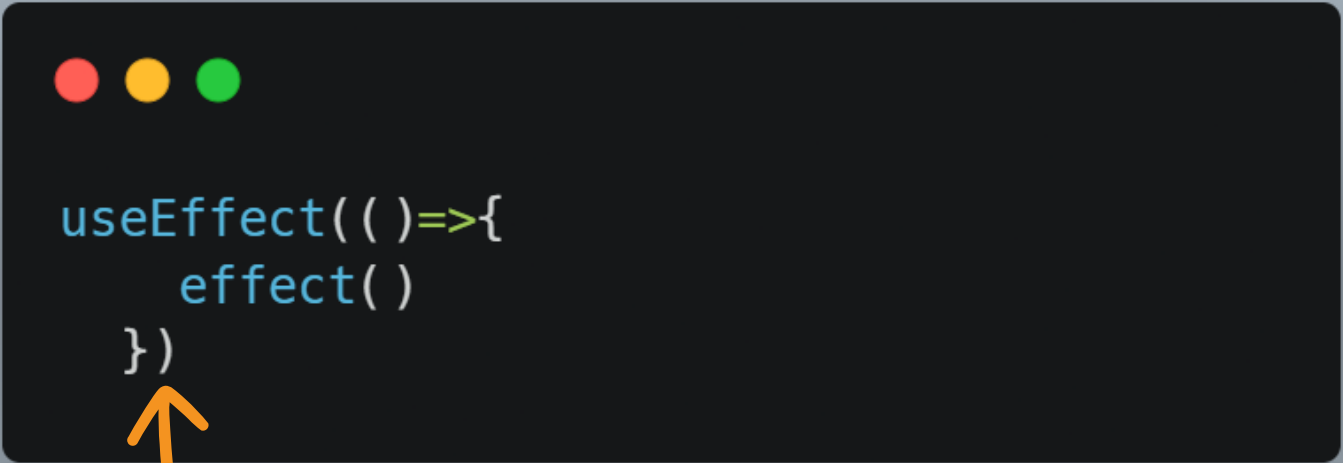

useEffect()

[RajatChoudhary.](#)

◀ SWIPE

By applying this Hook, you notify React that the component needs to perform something **after rendering**. React will remember the function you gave and call it later after making the **DOM modifications**.

```
useEffect(()=>{  
  effect()  
})
```

no dependency array: effect will run on every render

```
useEffect(()=>{  
  effect()  
}, [])
```

empty dependency array: effect
will run on first render

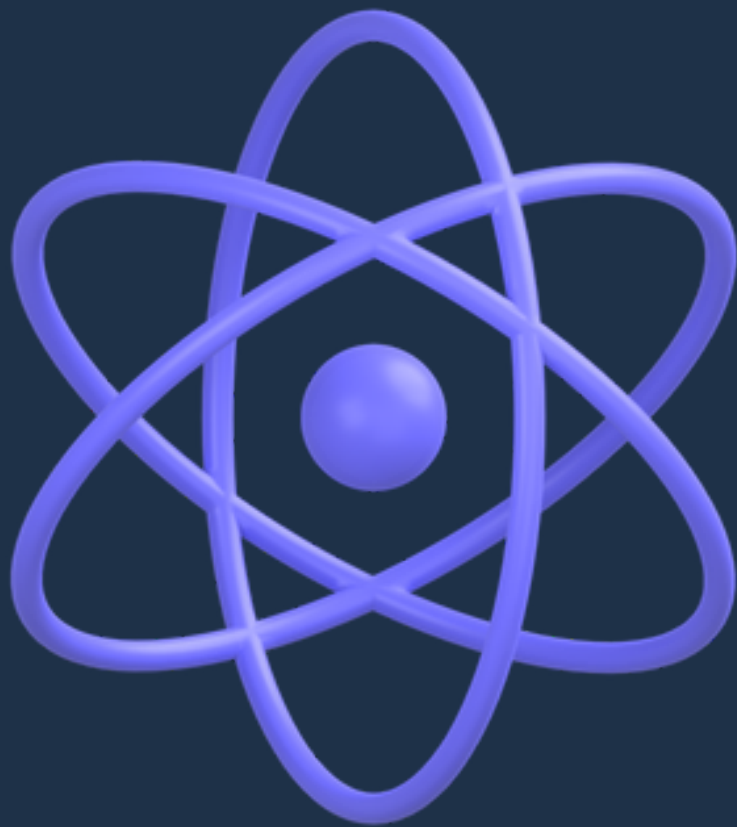

```
useEffect(()=>{  
  effect()  
}, [dep])
```

non-empty dependency array:
effect will run when dependency
changes
